This Environmental Report covers the environmental performance of the Civil Aviation Department (CAD) in 2023.

In the work of environmental management, the Department strives to minimise the disturbance caused by aircraft operations to the local communities and pursue environmentally friendly operations both in various functional areas and office management.

Our Environmental Goals

CAD is committed to ensuring that all services provided by the Department as well as our operations are conducted in an environmentally responsible manner.

Our Environmental Policy

We support the Hong Kong Special Administrative Region Government's initiatives to improve the environment by:

- Committing to a safe, efficient and sustainable air transport system in Hong Kong;
- Compliance with relevant environmental protection ordinances;
- Striving to minimise the adverse effect that the development of the aviation industry may cause to our quality of life and environment;
- Promoting waste reduction, recovery and recycling, and reduction in consumption of resources including material, fuel and energy; and
- Providing environmental education and training to staff.

2. AIRCRAFT NOISE MANAGEMENT

2. Aircraft Noise Management

CAD is conscious of any possible noise impact that aircraft operations may have caused to local communities. A number of aircraft noise mitigating measures have been implemented with reference to the guidelines of the International Civil Aviation Organization (ICAO), aiming at mitigating noise impact caused by the aircraft without compromising aviation safety.

We have also monitored the implementation of these noise mitigating measures and the aircraft noise situation in various districts with the aid of a computer-based Aircraft Noise and Flight Track Monitoring System.

Quieter Arrivals

Arrivals from Southwest over Water

All arriving aircraft between 11 pm and 7 am of the following day¹ are required to approach from the southwest of the airport over water, unless there are safety and weather conditions. This measure aims at reducing the number of aircraft overflying populated areas such as Tseung Kwan O, Sai Kung, Ma On Shan, Sha Tin, Kwai Chung, Tsing Yi, Tsuen Wan and Tuen Mun (Siu Lam/ Tai Lam Chung) during the overnight period.

In 2023, 87% of arrival aircraft were able to approach from the southwest of the airport under permissible conditions.

Continuous Descent Approach Procedure

All aircraft approaching the airport from the northeast between 11 pm to 7 am on the following day are encouraged to adopt the Continuous Descent Approach (CDA) procedure when safety and weather conditions do not allow night arrivals to approach from the southwest.

The CDA procedure requires the aircraft to fly higher and adopt a lower power setting and drag configuration during the commencement of the approach, thereby reducing aircraft noise impacts to areas such as Tseung Kwan O, Sai Kung and Ma On Shan.

Figure 2-1: Route of arriving aircraft from southwest at night

Figure 2-2: Diagram illustrating CDA procedure

¹ Prior to 16 May 2023, the implementation time period was between midnight until 7 a.m. on the following day.

Departures via West Lamma Channel

All aircraft taking off to the northeast between 11 pm and 7 am of the following day are required to use the southbound route via the West Lamma Channel, unless there are safety and weather conditions, thereby avoiding flying over populated areas such as Kowloon, North Point, Shau Kei Wan and Chai Wan.

In 2023, 98% of aircraft taking off to the northeast between 11 pm and 7 am of the following day were able to take this southbound route over the West Lamma Channel.

Quieter Departures

Noise Abatement Departure Procedures

All aircraft departing to the northeast are required to adopt the Noise Abatement Departure Procedures stipulated by the ICAO so long as safe flight operations permit.

These procedures require aircraft to reduce power setting upon reaching an altitude of 800 feet or above, so as to alleviate aircraft noise impact during take-offs on communities in the vicinity of the airport.

Figure 2-3: Route of departure aircraft to northeast at night

Improving Track Adherence

We have introduced a set of noise mitigating departure procedures which make use of satellitebased navigation technology for noise mitigation.

Aircraft which are properly equipped to use the technology, when departing to the northeast of the Hong Kong International Airport (HKIA), can make use of the on-board navigation capabilities to adhere closely to the nominal centre line of the flight track during their turn to the West Lamma Channel. With better track-keeping accuracy, the aircraft will be kept at a distance from the populated residential areas. In doing so, the aircraft noise footprint can be confined and the overall aircraft noise effect on these residential areas can be reduced.

Restrictions on Noisy Aircraft

Apart from implementing the aircraft noise abatement procedures mentioned above, CAD prohibits aircraft that are not meeting the relevant aircraft noise standards from landing and taking off in Hong Kong.

Since 2002, aircraft which do not comply with the noise standards stipulated in Chapter 3 of Annex 16 Volume I, Part II to the Convention on International Civil Aviation ("Chapter 3 noise standards") are not allowed to land or take off in Hong Kong. Furthermore, starting from 2014, airlines are not allowed to schedule aircraft whose noise levels only marginally meet the Chapter 3 noise standards¹ to land and take off in HKIA.

Since March 2019, CAD has taken the initiative to impose additional operating restrictions on aircraft which do not comply with the noise standards stipulated in Chapter 4 of Annex 16 Volume I, Part II to the Convention on International Civil Aviation ("Chapter 4 noise standards"), or equivalent, to operate at the HKIA from 10 pm to 7 am of the following day.

Noise Monitoring

CAD has installed an Aircraft Noise and Flight Track Monitoring System (ANFTMS) to monitor the implementation and effectiveness of various noise mitigating measures, and the noise environment in various districts. The system comprises multiple outdoor noise monitoring terminals (NMTs) which are installed at a number of strategic locations in Hong Kong to monitor and record noise data for aircraft operating into and out of HKIA, and a computer system which correlates noise data collected with the actual aircraft flight tracks detected by CAD's radar system.

In view of the commencement of operation of the North Runway since July 2022, CAD has expanded the use of ANFTMS through the installation of additional NMTs at the strategic locations close to the flight paths of the North Runway.

Figure 2-4: Outdoor noise monitoring terminal

¹ Marginally Compliant Chapter 3 (MCC3) aircraft are defined as subsonic jet aircraft which comply with the noise standards stipulated in Volume I, Part II, Chapter 3 of the Annex 16 to the Convention on International Civil Aviation by a cumulative margin of not more than 5 EPNdB.

3. AIRCRAFT EMISSION

08

Most aircraft operating at the HKIA comply with the engine emission standards as stipulated in Annex 16, Volume II to the Convention on International Civil Aviation.

With the growing attention to the climate change caused by the greenhouse gas (i.e. carbon dioxide), CAD has been closely monitoring the development of guidelines from ICAO on the reduction of carbon dioxide emission from aircraft operations and conveyed the guidelines to the industry.

Q

09

Measures Taken by CAD

Being the air navigation services provider, CAD has from time to time reviewed air routes and air traffic management arrangements by making reference to the latest ICAO guidelines.

Taking advantage of the latest development in satellite-based navigation technologies, CAD has arranged enhancements of the air route system which enabled shortened travelling distances and allowed more aircraft to fly at optimum and fuel efficient altitudes, thereby achieving fuel savings and a reduction of carbon dioxide emission.

CAD would continue to keep in view the development of the latest ICAO flight procedure criteria, progressively apply more advanced aviation technologies as appropriate and closely work with other air traffic control authorities and airline operators for further enhancing the air route system in the Hong Kong Flight Information Region.

I

Q

Measures Taken by Airlines

The aviation has been actively working to achieve sustainability by introducing newer, more fuel-efficient and quieter aircraft advanced equipped with navigation technology. Looking ahead, the aerospace developing hydrograncompanies are eliminate aircraft powered aircraft to greenhouse gas emission.

In 2023, 11 old generation legacy planes were retired and replaced with a similar number of modernised aircraft. Additionally, some airlines have started using sustainable aviation fuel alongside traditional jet fuel. This initiative is an important step toward reducing carbon emissions, and its benefits are expected to grow substantially in the long term.

The aviation sector is committed to ambitious decarbonisation goals of net-zero emission by 2050 through investing in modern, fuel efficient aircraft leading the way towards a greener future for air travel.

Carbon Emission Certification

Q

To mitigate aviation's environmental impact, the ICAO published requirements relating to Standards and Recommended Practices on the certification of aircraft carbon emissions in July 2017. This initiative aimed at reducing the contribution of aviation greenhouse gas emissions to global climate change.

The requirements stipulated that any aircraft models applying for this type certification on or after January 1, 2020 must comply with these standards. This means the design of next generation of aircraft models will focus on increasing fuel efficiency, achieving carbon-neutral growth and an emission reduction.

By establishing these certification standards, ICAO has paved the way for aircraft and engine manufacturers to develop ecofriendly products, which is significant for mitigating climate change and achieving sustainable development.

Q Ca

Carbon Offsetting and Reduction

ICAO decided in October 2016 to implement the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA) as one of the measures to contribute to carbon neutral growth from 2020 onwards.

The scheme aims to complement a broader package of measures for implementation by the aviation sector including the technological advancement on fuel efficient aircraft, improvement on operational procedures to reduce fuel consumption and promotion of the use of sustainable alternative fuels.

As part of the scheme, aeroplane operators in Hong Kong have already started monitoring their CO₂ emissions from international flights and reported the relevant statistics since 2019.

11____

4. GREEN MEASURES IN OTHER AVIATION RELATED OPERATIONS

4. Green Measures in Other Aviation Related Operations

12

CAD recognises the importance of environmental protection. Other than various green measures in aviation related operations that have been implemented, we would continue to explore means to infuse green measures into our operations to maintain sustainability of civil aviation.

Figure 4-1: Layout of e-filing system

Electronic Tools and Standardised Forms for Various Tariff and Flight Applications

The use of electronic tools and standardized forms for various types of applications has reduced the consumption of paper and processing time in the Air Services Office. As a result of the liberalization and change of approval mechanism of the Passenger and Cargo Fuel Surcharges respectively, the consumption of paper has been greatly reduced.

The use of e-filing as a platform for submission of flight applications and relevant information continues to contribute to reduction of paper consumption, which also greatly enhances readability and accuracy of the information provided. Applications pertaining to scheduled or non-scheduled air services permits and schedule changes via e-filing account for over 97% of the total applications.

Electronics Submission / Approval

13

Use of Electronic Flight Bags and Electronic Submission of Flight Standards & Airworthiness Related Applications

It is a requirement for airlines to carry a substantial number of documents on board for flight crew's reference during air operation, including but not limited to, navigation charts, emergency procedures, operations manuals, checklists, etc. Airlines may now use Electronic Flight Bags (EFB) to carry electronic copies of the required documents subject to CAD's approval.

This would significantly reduce paper documents carried on board or in-flight crew's carry-on flight bag. EFBs enable flight crew to review different documents such as air navigation charts, electronic flight plans, and maintenance manuals without using paper printouts, hence tasks could be performed and managed more efficiently and effectively during flight operations.

In addition, latest weather or air traffic information and other operational updates can be promptly dispatched to flight crew through EFB.

The application form for Operational Approval of EFB is available on the CAD website. Six local airlines have been approved by CAD to use EFBs as at the end of 2023.

APPLICATION FOR ELECTRONIC FLIGHT BAG OPERATIONAL APPROVAL Please complete the form in BLOCK CAPITALS using black or dark blue ink after reading the

This form is designed to elicit all the required information from those operators requiring the Electronic Flight Bag (EFB) operational approval. Completed form should be submitted to the Flight Standards and Airwortdiness Division (FSAD). (Ciril Aviasion Department Headquarters, 1 Tung Fai Road, Hong Kong International Airport, Lantau, Hong Kong.

he assessment to the application of EFB Operational Approval is based on CAD 562.

Application for Guided Tours of the Aviation Education Path

Since 2021, E-forms are available on the CAD website, (https://app.isp.cad.gov.hk/eform /dca931/vForm/EN/), to facilitate electronic application for visit to the Aviation Education Path by interested individual and groups with real time display of available guided tour sessions.

Online Promulgation of Divisional Documents

The "ATMD Information Dissemination Website", a website with secured access limited to divisional staff, was launched in September 2014 for the online promulgation of divisional documents of the Air Traffic Management Division (ATMD). It was at first used to disseminate roster information to colleagues through the Internet.

Since December 2014, the function of the website has extended to house and disseminate training materials, airport circulars, divisional information circulars, and materials of professional interest aiming to replace the traditional means of distributing hard copies to staff.

In order to reap further environmental benefits, since 2015, the use of the website has been extended to provide online access to divisional reference documents and their updates which used to be disseminated by CD-ROMs.

It is estimated that about 2,000 CD-ROMs have been saved each year since the implementation of this initiative. "ATMD Information Dissemination Website" has recorded over 15,300 visits in 2023.

Since August 2017, the distribution of internal Administrative Memorandum has been digitised to enhance the operational efficiency while being more environmentally friendly.

To further reduce the need for hard copies, all course plans have been digitised in 2021. With the significant reduction of hard copies to be distributed, it is estimated that about 13,000 sheets of A4 size paper have been saved in 2023.

Paperless ATMD Operational Manuals

In line with the departmental green measures, the Aeronautical Information Management Centre (AIMC) under the ATMD has been working on going green and all publications from AIMC are now in electronic format.

Aeronautical Publications (including Aeronautical Information Publication (AIP), AIP Supplement (AIP SUP), Aeronautical Information Circular (AIC) and Notice to Airmen (NOTAM)) of Hong Kong as well as the three ATMD operational manuals, namely Manual of Air Traffic Control (MATC), Manual of Aeronautical Information Services (MAIS) and Aeronautical Information Management Centre Quality Manual (AIMCQM) is distributed in electronic form via Hong Kong Aeronautical Information Services website. In 2023, a grand total of over 13,300 sheets of A4 size paper were saved.

To enhance accessibility of these operational manuals, the Operational Information Database System (OIDS) and CAD intranet were introduced for accessing these documents in operational areas.

5. GREEN HOUSEKEEPING

16

-

5. Green Housekeeping

CAD has been implementing a number of housekeeping measures in daily office operations to encourage energy conservation, paper conservation, waste collection and recycling, proper disposal of environmentally hazardous waste, green procurement and environmental awareness among all staff.

Energy Conservation

Daily Energy Saving Measures in Housekeeping

To reduce energy consumption in our daily office operations, the following environmentally friendly measures have been implemented in CAD buildings:

- Adhering to the Government recommended summer air conditioning setting of 25.5°C and use electric fans to improve air circulation and provide greater staff comfort when necessary;
- Turning off any air conditioning, lights, lifts, escalators, digital signage systems, and video walls, etc. when they are not in use;
- Periodically adjusting the operation period of essential external lighting to optimise energy usage in accordance with seasonal changes in daylight hours;
- Optimising the energy saving mode of non-essential lighting at lift lobbies from 50% to 100% off;
- · Switching off lights in pantries from midnight to early morning;

- De-lamping excess lights in corridors and common areas;
- De-lamping excess lights in corridors and common areas;Regularly reviewing the operating hours of Air Handling Units according to the latest occupancy patterns to avoid energy wastage;
- Turning off some lifts in Air Traffic Control Building, Office Building, and Facilities Building of CAD Headquarters and Backup Air Traffic Control Complex (BATCX) during non-peak office hours;
- Operating limited lifts outside normal office hours and using night mode lighting, suspending escalator service in the Office Building of CAD Headquarters;
- Encouraging colleagues to take the staircases instead of using lifts;
- Installing energy-saving timer devices in most share-used printers and photocopiers to cut down the consumption of electricity in standby mode during non-office hours;
- Checking lights and electrical appliances during security patrol outside office hours to ensure that they are switched off when not in use;

- Displaying reminders in all meeting/training rooms to draw users' attention to switching off lights and electrical appliances before leaving;
- Adopting solar films in strategic locations to cut down indoor heat and sunlight;
- Adopting motorised blinds in the atrium of CAD Headquarters to protect against sunlight and heat during sunny days;
- Incorporating environmentally-friendly installation during building construction, such as installing photovoltaic panels on the rooftop of CAD Headquarters. In FY 2023-24, the panels generated 15,336 kWh of electricity;
- Maintaining a green roof to reduce the temperature on the top floor;
- Reviewing occupancy patterns in CAD Headquarters before the summer season to optimise air conditioning supply schedules for different zones so as to reduce the overall cooling demands as well as the air conditioning operating hours;
- Reviewing the video wall operation schedule at CAD Headquarters to optimise energy savings.

Figure 5-11: Review of operation schedule of video wall to optimise energy savings

Energy Consumption

The Government has promulgated a 6% "Green Energy Target" for the period from FY 2020-21 to FY 2024-25. The energy consumption in FY 2018-19 was set as the baseline for comparison. The range of reporting has been expanded to incorporate non-electricity energy usage such as town gas and liquefied petroleum gas. In addition, the enlarged scope included energy use at infrastructure facilities.

Apart from energy consumption, the target also considered the generation of renewable energy such as electricity generated by photovoltaic panels. In FY 2023-24, the Department's energy performance improved by 5.9%.

	Energy consumption (Billed & RE)	Energy consumption under comparable operating conditions ¹	Renewable energy (RE) generation
FY 2018-19 (baseline)(kWh)	26,204,	431 (a)	17,233
FY 2021-22 (kWh)	27,937,669	25,152,615	19,273
FY 2022-23(kWh)	28,379,477	24,865,933	16,931
FY 2023-24(kWh)	28,485,138	24,675,478	18,436
Net change compared with the previous year (kWh)	105,661	-208,455	1,505
Change compared with (a) , (%) ²		-5.9% (b)	+0.0% (c)
Energy Performance (b)+(c) , (%) ²		+5.9	9%

² The change in operating conditions is mainly the change in accommodation occupied by CAD in the past years.

¹ Activities of bureaux/departments evolve over time in meeting the public service demands, which lead to changes of operating conditions and significant impacts on energy consumption such as operating hours, usage rate number of equipment, the floor area of venues, volume of water/sewage flow, etc. Such changes also bring significant impacts on energy consumption and adjustments (or normalisation processes) are therefore conducted to generate a more likely actual energy consumption under comparable operating conditions with baseline.

Carbon Audit and Energy Audit

CAD has engaged consultants to conduct energy audits for major CAD premises, including CAD Headquarters, Air Traffic Control Complex (ATCX) in 2015, and BATCX in 2015 and 2022. The energy audit reports issued in 2016 and 2023 recommended that CAD should continue to adopt its green measures and implement/maintain the following energy saving initiatives based on site conditions:

Keeping the air conditioning temperature setting at 25.5°C

Turning off lights near windows whenever possible

Labelling zone control plans alongside the switches

04

Lowering or closing blinds to block the sunlight

05

off the electrical Switching appliances when the facility is Since the initial internal carbon audit in 2017, CAD has performed annual carbon audits. The table below reports the outcomes over the last three years:

Voqr	Greenhouse Gas Emission per employee (tonnes of CO ₂)		
Tear	CAD Headquarters	ATCX	BATCX
2021	5.49	26.62	15.26
2022	5.59	35.56	34.18
2023	5.83	35.39	34.00

unoccupied

Remarks : For consistency and easy comparison, Greenhouse Gas Emission per employee is adopted in the Environmental Report since 2019 to give a fair comparison of Greenhouse Gas generated in the course of operation.

Paper Consumption

Daily Paper Saving Measures in Housekeeping

1 We advocate the "4-R principle" in paper consumption, which is summed up in the diagram below.

Measures on Paper Conservation

In addition to the routine housekeeping, we make the following arrangements to use less paper:

Since 2017, we have stopped printing copies of CAD Annual Report.

In 2021, the CAD Link followed the stoppage of printing copies. This arrangement has saved 55,000 sheets of A4 size paper annually;

Staff are encouraged to use fewer paper towels by posting notices at paper towel dispensers; and

Newspapers clippings are now electronically distributed instead of in hardcopy.

In 2023, an estimated 44,000 sheets of A4 sized paper were saved.

Paper Consumption

In 2023, we used 4,802 reams of paper, which represented an increase of 7.4% when compared to the level in 2022 (4,471 reams of paper). The less paper consumption in 2022 was mainly due to the work-from-home arrangement during the pandemic. A decrease of 7.2% when compared to the level in 2021 (normal working pattern) proved that the collective efforts made by each employee to conserve paper each day had been successful. Staff members are encouraged to continue the decreasing trend.

Waste Reduction, Collection and Recycling

Recycling Bins to Collect Waste Paper, Plastic Bottle, Metal Can, Glass Bottle, Glass Container and Rechargeable Batteries

For recycling, we collect old rechargeable batteries, used metal cans, plastic bottles, glass bottles, and waste paper. Recycling bins are provided in common spaces to make disposal for staff members and guests easier. Regular deliveries of the gathered items are made to recycler. The amount of recyclables collected in 2023 are shown in the table below.

Figure 5-13: Recycling bins

Recyclables	Amount Collected
Waste Paper	211 kg
Plastic	28 kg
Metal	35.5 kg
Glass Bottle	84 pcs
Rechargeable Battery	10 pcs

Figure 5-14: Food waste decomposition system in CAD Headquarters and Food Waste Collection area in Canteen

Food Waste Collection and Decomposition System

One of the main solid wastes in Hong Kong is food waste. Therefore, reducing food waste helps reduce the volume of garbage sent to landfills. A food waste decomposition system had been installed in CAD Headquarters in order to achieve this objective.

The CAD Staff Canteen at CAD Headquarters collects food wastes, which are then disposed of in the food waste decomposition system. Food wastes are transformed into liquid during the decomposition process by an enzyme, and some of the liquid is applied to the vegetation at CAD Headquarters as a natural fertiliser. The remainder is released as effluent. We collected around 3.16 tonnes of food waste in 2023.

Reduction of Waste in Staff Canteen

The Staff Canteen has taken the following steps to reduce other solid wastes in addition to treating the food waste collected through the food waste decomposition system:

Figure 5-15: Publicity materials about the ban of disposable plastic tableware for takeaway cutlery displayed in Staff Canteen

Food Wise Charter

Since 2016, we have signed the Environmental Protection Department's Food Wise Charter. After participating in the Charter, regular evaluations in the canteen meeting of waster reduction measures are conducted.

The management, staff, and Staff Canteen operator keep close communication with one another through the Canteen Sub-committee.

The watering system at CAD Headquarters uses collected rainwater and air conditioning condensate water.

The following table displays the irrigation water saved in 2023:

Figure 5-16: "Don't be a Big Waster" Poster displayed in Staff Canteen

Figure 5-17: Irrigation Sprinkler

Buildings of CAD Headquarters	Facilities Building	Office Building	Air Traffic Control Building
Annual Irrigation Consumption (L)	4,915,580	148,712	2,081,422
Annual Recycled Water Collected for Irrigation (L)*	785,000	253,000	530,000
Percentage of Saving	16%	17%	25.4%

*Including the water recycled from the cooling tower.

Green Procurement

CAD follows the guidelines as set out in the Government's green procurement policy (including Environment and Ecology (Environment Branch) Circular Memorandum No. 1/2021 on "Green Procurement in the Government" with revision in February 2024) and avoids procuring single-use disposable items. In 2023, we placed 178 orders totaling HK\$35,010,695.50 to procure green products and services. The major items procured included desktop computers, network products, toner cartridges and water dispenser.

Below are some examples of green procurement measures implemented:

Procure operation equipment, office equipment and other electrical appliances having energy label;

> Figure 5-20: Energy Label issued by Electrical and Mechanical Services Department

Choose green products such as refilable ball pens, mechanical pencils and recyclable laser printer cartridges;

Review the operational need against monthly supply items regularly, particularly for those items with expiry dates;

Avoid using items that are environmentally unfriendly, for example, correction fluid and batteries containing mercury;

Incorporate terms requesting Contractor to follow green guidelines in new cleansing contract; and

Follow the general guidelines on matters relating to purchase and disposal of regulated electrical equipment (REE), e.g. air conditioner, refrigerator, computer and printer, etc. During procurement, we recommend the following green measures to the suppliers for their preparation of tenders and performing the contract:

All documents printing on both sides and on recycled paper, avoiding paper that exceeds 80 gsm;

Avoid the use of plastic laminates, glossy covers or double covers as far as possible;

Use single line spacing and avoiding excessive space in the margins and in between paragraphs;

Minimise the use of packaging material; and

For those carton boxes used for packing, made from 100% recovered fiber is preferred, given that it is strong enough for storage, stacking and transit.

Electric Vehicles

Electric vehicles are used more frequently in Hong Kong to reduce the city's air pollution. Since 2013, CAD has started replacing its fuel-propelled saloon vehicles with electric ones. Currently, out of our current fleet of six saloon vehicles, five of them are electric vehicles. Two 18-seat vehicle will be procured by the Government Logistics Department and tentatively completed in 2025.

In order to encourage on-site service contractors to use electric vehicles when delivering service to the Department, sufficient charging facilities are provided in CAD Headquarters and outstations. The contractors have also been encouraged to replace their fleet with electric vehicles.

Training and Communication

Environmental Management Committee	01	Appointment of Green Managers and Energy Wardens	02
The Departmental Green Manager serves as the Chairman of the Environmental Management Committee (EMC), comprising of representatives from each division to encourage environmentally conscious management within the Department and to recommend environmental goals, policy, objectives, and targets. The Committee is convened to discuss green ideas, raise staff awareness, observe and report on the implementation of green measures in order to accomplish the environmental protection targets.		To oversee and coordinate divisional green management issues, each division has designated an officer as the Green Manager. Additionally, Energy Wardens were appointed to encourage and remind personnel to follow daily energy-saving and green housekeeping practices in the workplace. There were 38 Energy Wardens in total for CAD Headquarters, ATCX, and BATCX in 2023 and they received regular briefings in order to get them acquainted with the latest knowledge.	
Green Tips to all CAD Staff 03		Training for New Recruits	04
CAD has established a Green Corner in the CAD Information Sharing Portal. It acts as a platform for dissemination of environmental management guidelines and green advice among CAD staff, including circulars and pamphlets on waste prevention techniques in the workplace and energy- saving measures. The relevant information would also be re-circulated to staff by electric means regularly. Divisions were encouraged to display the green advice and housekeeping measures at prominent locations of the office.		Since 2017, CAD has incorporated a session introduction of green management in orientation programme for officers newly the Department. This ensures that they good grasp of and adhere to the depart green policies and practices.	n on an ato the joined had a mental

Application of Technology in Enhancing Energy Efficiency

Application of Artificial Intelligence (AI) in Energy Optimisation System

CAD has been exploring ways to enhance the most energy-consuming component of electricity resources – the air conditioning system. Energy Optimisation System (EOS) was adopted to optimise the control of the central air conditioning system. After some years of implementation, AI features were added to upgrade the EOS into AI-EOS to drive further energy efficiency.

Figure 5-22: Upgrade of EOS into AI-EOS

Unlike EOS with rule-based algorithm, this technology adopts neural network, with different input operation parameters to continuously learn and optimise chiller operation efficiency for energy saving.

The application of AI-EOS has provided an effective means to enhance energy efficiency and at the same time to reduce carbon emission for central air conditioning systems which are widely used in headquarters and commercial buildings. As a result, an extra 3.3 % reduction in the annual energy consumption from chiller plant operation was achieved since 2022.

Recognition

Indoor Air Quality

We support the Clean Air Charter, and implemented measures to lessen emissions from our daily operations.

In order to keep track of the indoor air quality condition, the Indoor Air Quality (IAQ) of CAD facilities has continued to be evaluated yearly. The CAD Headquarters, the ATCX and the BATCX received the "Excellent Class" IAQ Certificate in 2023.

We were awarded "Excellent Class" Premises (Whole Building) for New IAQ Objectives Award. The ceremony was held on 8 May 2024.

Hong Kong Awards for Environmental Excellence

The objective of the Hong Kong Awards for Environmental Excellence (HKAEE) is to inspire organisations to implement environmental management, measure their adherence to best practices within their sectors; and recognise and applaud the achievements of organisations with excellent performance.

CAD took part in the 2023 HKAEE under the Public and Community Services Sector, demonstrated our commitment to green leadership, environmental communication and training, continual improvement management, and promotion and implementation of a range of environmental initiatives.

Figure 5-26: CLP Smart Energy Award 2023

CLP Smart Energy Award 2023

The award aims to encourage businesses and organisations to deploy innovative technologies, smart management and other energy-saving measures to enhance operational efficiency and realise green opportunities. The three major award categories are Innovation, Carbon Management and Energy Management. In addition, Renewable Energy Contribution Awards, Joint Energy Saving Awards, Sustainable Vision Awards and the new Low-Carbon Driving Awards will be presented, in recognition of organisations with contributions for energy conservation and carbon reduction. CAD won the Innovation Award _ Excellence under the category "Corporate/Government bodies" in recognition of contributions for energy conservation and carbon reduction.

6. VIEWS AND SUGGESTIONS

CAD Environmental Report in the previous years can be found in the CAD website
